Acknowledgment

The acreage, production, utilization, monthly and season average price, and crop value statistics for Florida as shown in this summary are official estimates of the Florida Crop and Livestock Reporting Service. Corresponding data for other citrus states are from official reports of the USDA, Statistical Reporting Service. Canned and frozen pack statistics were compiled by the Florida Citrus Processors Association. Where data are from other sources, appropriate references appear.

Records of the Division of Fruit and Vegetable Inspection, Florida Department of Agriculture and Consumer Services, were employed in production and utilization estimates. The Citrus Administrative Committee assisted in assembling these data.

Many producers, shippers, canners, sales agencies, transportation firms, and others associated with the citrus industry voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

The report was assembled under the direction of James W. Todd and Robert R. Terry of the Florida Crop and Livestock Reporting Service.

FLORIDA WEATHER HIGHLIGHTS, SELECTED AREAS AND MONTHS, 1984-85 CROP YEAR

For the second consecutive season, Florida citrus growing areas experienced a major freeze. The below freezing temperatures in December 1983 followed by the January 1985 freeze produced the worst tree loss of this century. Many trees that were left in a weakened condition following the December 1983 freeze were killed by the freezing temperatures on January 21-22, 1985.

January and February 1984 temperatures were moderately cool, with bloom occurring mid-March to mid-April. Even the northern counties where heavy defoliation had occurred following the Christmas 1983 freeze, flushed out new growth and set a reasonably good spring bloom. Rainfall was mostly adequate throughout the spring with only slight moisture deficits preceding the usual summer rains which began in late June. Good growing conditions prevailed and many trees damaged by the cold began to flush out new growth.

By late summer, rainfall had moderated seasonally and growers were forced to start irrigation to maintain adequate soil moisture. An early October cool front moved through the State, but with only small amounts of rainfall. Slight leaf wilt was still occurring in some areas and the need for irrigation continued.

Scattered rainfall and moderate temperatures marked November weather, with growers irrigating where possible and cool nights and warm days promoting color break on most citrus types.

December temperatures were generally above normal levels except for the eighth and ninth when a cold front moved through the State. There was some scattered leaf burn when temperatures dipped to below 30 degrees in a few central and north central spots. The absence of rain throughout the rest of the month slowed tree growth and helped promote semi-dormancy.

On January 5 - 6 a cold front brought freezing temperatures to central growing areas and again on the 12th and 13th temperatures dipped to the low 30's. The coldest temperatures, however, occurred on the 21st and 22nd when a hard freeze occurred in most areas of the State except the extreme lower portion. Temperatures in the high teens were recorded in the northern citrus counties. Readings were the coldest in pockets and low ground areas. Lows in the teens and low 20's killed many trees along the upper most producing counties from Pasco through Lake, Orange and Volusia and northward that had been weakened by the December 1983 freeze. Considerable tree loss also occurred in north Brevard, Osceola, Polk, and Hillsborough counties. The lower East Coast reported the fewest hours below 28 degrees but considerable defoliation occurred in all areas. Low 20 degree readings in some Martin County locations caused severe defoilation and killed trees that were in a weakened or declining state.

The week following the hard freeze was very cold which slowed dehydration of damaged fruit. February continued with just moderately cool temperatures, except for the period from the 9 - 15 when sub-freezing weather invaded the citrus belt, bringing heavy frost but little damage. Rainfall was light and many growers irrigated to stimulate new growth and bloom bud formation.

March weather had warm daytime temperatures with very little rainfall until late in the month, when on the 21st and 22nd most areas received up to 3 inches preceding a cool front that dropped temperatures into the 40's and low 50's.

April temperatures were generally cooler than normal with showers occurring on a regular basis. However, growers continued to irrigate to avoid leaf wilt on trees flushed with new growth.

1984-85 PRODUCTION AND TREE CENSUS

PRODUCTION

Florida's season began with bloom occurring mostly in the last three weeks of March and the first week of April. Fruit set was variable because of the effects of the previous December freeze. Most trees in the northern areas set varying amounts of fruit.

The initial October forecast of 119 million boxes of oranges was up slightly from the previous season's December freeze reduced harvest of 116.7 million boxes. Final harvest was again reduced by the freeze on January 21 and 22, 1985 and 103.9 million boxes were utilized.

Grapefruit harvest was 41.1 million boxes. Virtually no grapefruit was set in the Upper Interior or upper portions of Polk County so only moderate amounts were lost. East Coast growing areas, which have the greatest portion of the crop, suffered slight losses but a higher portion of the total grapefruit went to processing than normal.

Specialty crop production was also reduced from previous seasons except for Tangelos which were unchanged and limes which increased. No freeze damage or loss was reported for limes in Dade County.

FCOJ final yield for all oranges was 1.37582 gallons per box with early-mids at 1.39083 and Valencias at 1.35988.

California's orange production of 52,000,000 boxes was slightly above the previous season's 48,500,000 boxes, but 32 percent less than 1982-83 production of 76,100,000 boxes. Grapefruit production was 7,900,000 boxes, up from 7,240,000 the previous season. Lemon production was up slightly but tangerine production was down.

Arizona orange production was 2,450,000 boxes, up from 1,800,000 boxes but still less than the record high 1982-83 production of 3,800,000 boxes. Both grapefruit and lemon harvests were higher than the past two seasons.

Texas citrus trees were devastated by the December 1983 freeze and no commercial citrus was produced during the 1984-85 season. Tree losses were very heavy from that freeze and the following freeze in January 1985. Only limited amounts of fruit can be expected in coming seasons.

CITRUS BOX WEIGHTS: Approximate net weight in pounds by fruit type and States

States	Oranges and others 1/	Grape-fruit	Tan-ger-ines	Lemons	Limes

Calif.	75	65	75	76	--
Texas	85	80	--	--	--
Arizona	75	64	75	76	--

1/ Includes Florida Temples and Tangelos at 90 lbs.

TREE CENSUS

The Florida Crop and Livestock Reporting Service first began indexing the State's commercial citrus groves on aerial photography as of January, 1966. Ground crews in 4-wheel drive vehicles identify all the State's groves by year in which set, fruit type, and row spacing. Photo interpreters in the Orlando office then delineate the groves by variety blocks on positive photo transparencies at a scale of 1 inch to 660 feet. Variety blocks are measured with planimeters to obtain acreage and then indexed by land section.

The inventory was designed for quick and economical updating. Since 1966, the production area has been resurveyed each second winter--1968 through 1984--to determine changes. Photographing begins in November when weather conditions are most favorable and is generally completed in 80 to 90 days. The same three-mile-wide flight lines established in 1966 are photographed on each succeeding flight. Approximately 14,000 square miles of photography is obtained at a 1 to 30,000 scale.

The last statewide survey was conducted as of January 1984, immediately following the severe freeze that came through the production area on Christmas 1983. The northern one-third of the citrus belt was devastated, rendering field enumeration very difficult. For that reason, a 14 county area was sampled for an aggregate count, with the expectation of conducting a resurvey when conditions improved.

A special survey in the 14 counties most severely affected was conducted in the spring and summer of 1985 and shows 118,509 fewer acres of citrus than were reported a year earlier. Total acreage remaining viable in the 14-counties, excluding 1984 and 1985 trees set is 58,973 acres, down from 177,482 acres in 1984 and 277,536 acres in 1982.

Photography for the 1986 survey began in November 1985 and field work has begun in all areas. Updated tree numbers and acreages will be available in late summer 1986.

FLORIDA, ALL CITRUS: Acres in commercial groves as of January, 1966 - 1984, with percent changes

Year	Acres	Change from previous survey	Change from 1966 survey
		Percent	
1966	858,082	—	--
1968	931,249	+8.5	+8.5
1970	941,471	+1.1	+9.7
1972	878,019	-6.7	+2.3
1974	864,098	-1.6	+0.7
1976	852,369	-1.4	-0.7
1978	831,235	-2.5	-3.1
1980	845,283	-1.7	-1.5
1982	847,856	+0.3	-1.2
1984	761,365	-10.2	-11.3

1984-85 VALUE OF SALES, PRICES AND EXPORTS

VALUE

The preliminary on-tree value of all citrus for the 1984-85 season is a record high $1,044,821,000. This is 23 percent more than the 1983-84 revised season total of $849,457,000 and slightly more than the previous record high 1979-80 season total of $1,037,050,000.

Preliminary value is based on that part of the crop that was priced at harvest, about 30 percent of the total. When all participation plans and cooperative prices are finalized, a revised value is calculated.

The preliminary 1984-85 on-tree price of oranges was $7.75 per box, up from the 1983-84 season revised price of $5.75. Both fresh and processing prices were the highest of record reflecting the reduced crop size caused by the Christmas 1983 and January 1985 freezes. Early and midseason varieties returned $7.82 per box while Valencias returned $7.68 per box. Early-mids for processing returned $7.47 per box, up from last season's revised $4.96. Valencias for processing returned $7.59 per box, up from $6.55 the previous season.

Grapefruit prices were higher than revised previous season prices for all types and all methods of utilization. Fresh colored varieties returned $6.58 per box compared with the previous season's $5.25 per box. All processing returns were $2.28 compared with $1.70 the previous season.

All other types of citrus except limes and lemons provided higher returns per box reflecting reduced crop sizes because of the 1983 and 1985 freezes.

The 1984-85 season average delivered-in value for all priced fruit at processing plants going into FCOJ was $9.38 per box or $1.66 per pound of solids. Early-mids averaged $9.40 per box and $1.66 per pound solids and Valencias averaged $9.37 per box and $1.65 per pound.

FLORIDA, ALL CITRUS: Value of sales on-tree, crop years 1975-76 through 1984-85

Crop year	Value 1,000 dol.	Crop year	Value 1,000 dol.
1975-76	$ 440,326	1980-81	$ 953,350
1976-77	529,765	1981-82	713,324
1977-78	848,680	1982-83	876,777
1978-79	966,916	1983-84 1/	849,457
1979-80	1,037,050	1984-85 2/	1,044,821

1/ Revised. 2/ Preliminary.

COUNTY PRODUCTION

Estimates of citrus production by counties were prepared from objective survey data obtained from the citrus crop estimates program. Production for Florida has been distributed to counties based on the biennial citrus tree census, limb count survey data adjusted for droppage to end of season, and size data at maturity.

Tree numbers by county which are used in the estimates were obtained from the latest tree census. Data on production are obtained from several objective fruit surveys: limb count and size and droppage samples. Because of the statistical sampling design, counties with higher production in general have a greater number of fruit samples, and therefore estimates for these counties can be considered more reliable. Thus, for the same reason, estimates for the production areas are still more reliable.

PRICES

All on-tree prices represent the average price received by growers for their fruit by types. Prices are based on records of commercial fresh fruit and processed fruit returns. The term "on-tree" relates to fruit value before it is picked and hauled from the grove. Each season, beginning with the first month that three percent of a fruit type is harvested, monthly estimates are computed. Fresh fruit sales organizations and a mail-out questionnaire to packers provide the average F.O.B. price, and processors supply an average spot and cash price for fruit delivered to plants. From these values, an estimated charge for picking, hauling and packing is deducted to arrive at an on-tree price. The anticipated box utilization for the month is used to combine the fresh and processing price to obtain an average price for all methods of sales.At the end of the season, monthly price averages are computed and weighted by boxes utilized, to provide the preliminary season average price.

A year later, after most processed products are sold, cooperatives and firms with participation plans report prices of fruit they handled. These prices, combined with the spot and cash prices collected earlier, are weighted together, by varieties, to determine the final processing price received by growers. From this price, charges for picking, hauling and packing, as determined by University of Florida economists, are deducted to arrive at the final on-tree price received by growers.

FOREIGN EXPORTS

Fresh citrus exports to countries other than Mexico and Canada were greatly reduced this season primarily because of the freezes and the citrus canker threat. Grapefruit exports, especially to Japan, were off sharply. Japan received only 2,563,000 cartons compared with 6,242,000 the previous season. Total orange exports were only 10,000 cartons and no specialty citrus was exported.

There were 10.9 million gallons of FCOJ exported in the 1984-85 season. This compared with 12.8 million gallons exported last season. Canada is the major market for U.S. exports. There were 3.2 million gallons of concentrated grapefruit juice exported this season.

History of Florida's Citrus Industry

The citrus tree is a native of the Orient. From this area it was carried ever westward by man, to India, to the Mediterranean and on across the Atlantic. Citrus was brought to the Americas by Columbus. When he landed on November 22, 1493, he brought citrus seeds that were planted on the island of Haiti. The first seeds planted on the mainland of the Americas were brought by the expedition of Juan de Grijalva when he landed in Central America between July 12 and July 20, 1518. The exact date of the introduction of citrus trees into Florida is not known, but from a statement made by Pedro Medendez, dated April 2, 1579, it appears that citrus fruits were grown in abundance around St. Augustine at that time. Early settlers in Florida some two centuries later found wild citrus trees scattered over the State. One of the oldest, cultivated groves planted in Florida (Hume, 1926 p.95) is thought to have been the Don Phillipe grove in Pinellas County, planted sometime between 1809 and 1820.

Citrus production in Florida had reached an all time high of more than 5 million boxes when the Great Freeze of 1894-95 almost totally wiped out the citrus industry. It was not until 1909-10 that this level was reached again. Since that time the volume steadily increased. In 1984-85, Florida had 68.8 percent of the Nation's production.

Source: See Page 45, Data Sources, Item 5.

Footnote 2/ for page 32, 1/ for pages 33 and 34. Final Mexican shipments to the U. S. are reported by FAS as a combined total for oranges and tangerines. The total shown on pages 32 through 34 has been broken down proportionally into oranges and tangerines from Plant Quarantine data reported at the time of the crossing. Plant Quarantine releases give separate totals for these two types of citrus. Mexican shipments, through the U.S. to Canada are not included.

ACKNOWLEDGMENT

The acreage, production, and value statistics in this bulletin are official State and USDA estimates prepared by the Florida Crop and Livestock Reporting Service. The county and area detail were made possible by the participation of the Department of Food and Resource Economics, University of Florida, in the estimating program. The Bureau of State Markets, Florida Department of Agriculture, and the County Extension Agents, University of Florida, Cooperative Extension Service, were also very helpful in supplying area and county information. Shipment statistics were provided by the Market News sections of the Florida Department of Agriculture and the USDA Agricultural Marketing Service.

Grower organizations have provided valuable assistance and data throughout the season. These groups include the Florida Celery Committee, Florida Tomato Committee, Florida Sweet Corn Exchange, South Florida Vegetable Exchange, Zellwood Sweet Corn Exchange, and North Florida Growers Exchange. Sales agencies and transportation firms provided the inputs necessary to complete the statistical story.

Foremost, the growers, shippers, and processors volunteered most of the basic data used in developing these official statistics. The public spirited cooperation of these individuals and groups is appreciated.

Fieldmen James Spires, Immokalee; Charles Robertson, Homestead; Wallace Jacobs, North Palm Beach; and Larry Amlong of Palmetto collected much of the basic acreage, production, and price statistics in this bulletin. This report was assembled under the direction of Jerry Campbell, Bill Erwin, and Dan Marquis of the Florida Crop and Livestock Reporting Service and Buck Buchanan, Bureau of Market News. The authors also wish to thank Becky Altman, Ray Crickenberger, Marcelo Diaz, Kitty Hildreth, Pat Quittence, Tommy Scherer, Pat Todd, and others of the Florida Crop and Livestock Reporting Service who assisted in compiling and preparing this report.

Summary of Shipments by Crops, by Months, 1984-85	--	--	48	--

DEFINITIONS AND EXPLANATIONS

SEASONAL GROUPS--During the growing season, estimates were prepared for most crops on a six month seasonal group basis. The periods are for the crop year July-December and January through June. The two six month periods were combined in this publication into a crop year total for all crops. Production sold or utilized is shown by months.

PLANTED ACREAGE is the total acreage which has been planted for harvest during the crop year. Acreage lost and replanted to the same crop in time for harvest in the same quarter is counted only once. Acreage harvested and planted again to the same crop is counted twice.

HARVESTED ACREAGE is the acreage partially or completely harvested. Acreage lost before or at maturity through natural or economic causes is not included in the acreage for harvest.

YIELD is the average production per acre of merchantable quality harvested and sold or utilized.

PRODUCTION is the quantity actually harvested and sold or utilized.

UNIT VALUE for fresh market sales is the equivalent price received, f.o.b. shipping point basis and encompasses all grades and sizes marketed or utilized. Included are packing charges, selling charges, precooling, top ice, or other costs which contribute to the value of the product at shipping point. The value per unit for quantities sold to processors is the average value paid for usable quantities, on a "delivered to plant door" basis. This value includes transportation and other normal costs incident to delivery at plant door.

TOTAL VALUE is the equivalent value of production sold or utilized based on the unit value. Cullage and other quantities not sold or utilized because of natural or economic factors are excluded.

OTHER COUNTIES include harvested acreage for all counties for which either published data would result in the disclosure of individual operations or acreage totals for specific commodities are of minor importance in the State.

All shipments and unloads, rail, truck, air, and boat, are recorded nationally in 10,000 pound units each day. Annual releases are in 1,000 cwt. In this publication, shipments and unloads for some commodities were converted to most common trading units. Rail and piggyback weights and conversion factors were determined by several Market News Service field offices. Mixed car (rail) loadings by stations have been prorated by commodities.

Where possible, the national Market News Service in Washington, D. C. has established a single uniform weight per commodity to be used nationally in converting to weight units for the various means of transportation. Weights per common container used and number of units per rail car or truck may be obtained by writing the MNS office in Winter Park, Florida.

PRODUCTION AND PRICE UNIT--The official USDA vegetable crop estimates are published on a weight basis. For this bulletin, the official estimates for most vegetable crops have been converted to what is believed to be the most commonly used containers. If changes in container weights are necessary, all data pertaining to the production of the commodity in question are revised to maintain comparability between years. The table below gives the net weight used per container and the number of containers per hundredweight.

PRODUCTION AND PRICE UNIT

Most common unit, estimated net weight, number of units per hundredweight,
principal vegetable commodities, Florida, 1984-85 crop season

Commodity	Unit	Est. net weight	No. of units per cwt	Commodity	Unit	Est. net weight	No of units per cwt
		Pounds				Pounds	
Snap Beans	Bushel	30	3.333	Lettuce	Cwt	100	--

Escarole	Crate	25	4.000	Watermelons	Cwt	100	--

SUMMARY OF THE 1984-85 VEGETABLE SEASON

The farm value of Florida-grown vegetables, melons, potatoes, and strawberries sold in the 1984-85 crop year totaled $1.0 billion, slightly less than the 1983-84 crop year. Crops increasing in value were cabbage, carrots, sweet corn, cucumbers, potatoes, squash, and strawberries. Crops with lower values than the previous year were snap beans, celery, eggplant, escarole, green peppers, radishes, tomatoes and watermelons. Most of the declines in total crop value were due, in large part, to lower season average prices. Crops showing the greatest gains in harvested acres were cabbage, potatoes, cucumbers, carrots and lettuce.

Average yields for cabbage, carrots, sweet corn, cucumbers, green peppers, radishes, tomatoes, and strawberries were higher than a year ago. Yields for snap beans, celery, eggplant, escarole, lettuce, potatoes, squash, and watermelons averaged below the previous season.

Season average prices for sweet corn, potatoes, squash and strawberries increased from the previous year. However, season average prices for all other crops were down from a year earlier.

Land preparation, planting and transplanting were active for fall vegetable crops by mid-July. Normal summer weather with hot days, warm nights and evening thunderstorms prevailed into September. Planting progressed generally on schedule. Weather during September and October continued favorable. Irrigation was necessary, at times, primarily in the southwest during September.

Numerous cold fronts during November and December brought cooler temperatures to the production areas. Excessive rain in the southeastern area, during late November, resulted in some light crop damage. The first frost was reported in the southwest at mid-December. Irrigation was active during the last week of the year.

Early January was characterized by drying conditions and very little rainfall. Two severe cold fronts moved through the State January 20-23 bringing record setting low temperatures in the single digits to the northern and central areas and lows in the mid-20's to the southern areas. There was extensive crop damage in all production areas. As a result, supplies of most crops were reduced for several weeks.

Rainfall was generally light throughout February and March. Irrigation was active throughout this time. Warm days and mild nights prevailed. A heavy frost at mid-February, in inland areas of the southwest with strong winds resulted in some leafburn to tender crops. Another cold front moved through the vegetable areas the end of March, with some crop damage in Sumter County.

April was a month of mostly warm days and mild nights. Irrigation was active throughout the month. Harvest was underway for some crops while others were declining seasonally.

Dry weather continued into May. Daytime temperatures were hot and the nights warm. Some hail was reported in scattered areas the last week of the month with no substantial damage. Harvest continued active for many crops but was declining seasonally.

June was punctuated with record setting high temperatures during the first two weeks at many locations. A severe thunderstorm passed over a portion of Palm Beach County during the first week with strong winds and golf ball size hail. The first generally significant rains of the year occurred at midmonth. Typical summer weather patterns prevailed for the remainder of the month. Harvest was essentially complete for most crops, in the major producing areas, by the end of the month.

Most of the weather data for this summary were supplied through the National Weather Service, U.S. Department of Commerce, Ruskin, Florida. Information on the effects of weather on crops was provided by the Florida Crop and Livestock Reporting Service fieldmen.

SNAP BEANS
1984-85

Florida growers produced 4.1 million bushels of bush and pole beans during the 1984-85 season for fresh and processing utilization, down 9 percent from a year earlier. Acreage harvested for fresh and processing totaled 46,900 acres, up 1 percent from the 46,500 acres harvested during the previous season. The average yield for the 1984-85 season was 87 bushels per acre for fresh market and 100 bushels per acre for processing, as compared with 96 bushels and 100 bushels, respectively, for the previous year.

The average f.o.b. price of $8.99 per bushel for fresh market was 23 cents lower than the previous year. At $4.50 per bushel, the snap beans for processing price was unchanged from last season. Total value, at $36.1 million, was 10 percent below last year.

Snap bean production extended from mid-October into mid-June. The fall crop peaked in December. Marketings declined dramatically following a late January freeze and did not recover fully until March. Production for the season peaked in April with about 27 percent of the marketings during the month.

Heavy rains in September delayed plantings and reduced stands. By mid-October, fields were in mostly good condition with near ideal weather prevailing into January. Freezing temperatures the third week of January, throughout much of the southeastern growing area, devastated much of the crop. Considerable acreage was replanted as a result of this freeze. Favorable weather resumed in February with the crop making good progress in all production areas. Hot, dry weather commencing in mid-May and running through the rest of the season, in the west central and northern areas resulted in the loss of some fields. Quality was generally good throughout the season. Yields were down somewhat, in all areas, from the previous year.

Bush beans are grown in all areas of Florida with the exception of the east central and southwest areas. The southeast continues to be the major producing area. Pole beans are grown primarily in Dade County, with small acreages in Gadsden and Marion counties and the west central area.

Earliest fall supplies of snap beans originate from west Florida. The northern and west central areas, the Everglades and southeastern districts also provide fall production. The southeast is the sole source of supply during the winter. The other areas resume production in the spring.

CABBAGE
1984-85

Florida's cabbage growers produced 7.7 million crates and bags of cabbage during the 1984-85 season. Production at this level is 66 percent greater than the previous year and the highest since the 1978-79 season when 8.4 million crates were produced. The gross value was $50.8 million, a 25 percent increase over the previous year's total of $40.7 million. The average f.o.b. price was $6.58 per crate or bag, down $2.17 from the $8.75 received for the prior season's crop. The lower average price received was more than offset by the increased production, accounting for the increase in value.

Total plantings were 19,600 acres, up slightly from the 19,000 acres planted during the 1983-84 season. Acreage harvested amounted to 16,650 acres. This was 51 percent greater than last season which suffered considerable freeze loss. The average yield of 463 crates or bags per acre was up by 40 bags from the previous season's average.

Cabbage was available for market in early November and continued through June. Production during the fall months was up 55 percent from the previous fall. Production during the winter and spring period was up 67 percent from the year before. The peak months were April and January followed by March and May.

The Hastings area, which includes the three counties of Flagler, Putnam, and St. Johns, is the leading producing area in the State. This area accounted for 59 percent of the State's production during the 1984-85 season. The leading cabbage producing county is St. Johns with 4,900 acres harvested, or 29 percent of the State's total.

Direct seeding and transplanting got underway by mid-September. The most active period for transplanting was October through December. Direct seeding in fields occurred between August and November. Only a small percentage of the total acreage planted is seeded direct in fields.

First cuttings began in early November, increasing slowly into January. Record low temperatures during the third week of January caused extensive damage to the cabbage crop. Production dropped during February but had regained momentum by March. Harvest peaked in April, tapering off until the last cabbage was cut in Hastings, the end of June. Winter production accounted for 49 percent of the total production, equaling the most recent 5 year average for that time period. Spring production accounted for 42 percent and the fall months, 9 percent of total production.

CARROTS
1984-85

Production of carrots in Florida for fresh market and processing utilization during the 1984-85 season totaled 1.1 million cwt, up 51 percent from the previous season. Fresh use constituted 75 percent and processing 25 percent. This compares with 79 percent fresh and 21 percent processing the previous year. Approximately 25 percent of the fresh carrots were mini or finger carrots compared with 20 percent a year earlier. The remaining 75 percent were the regular type carrots.

There were 11,500 acres harvested from the 12,500 acres planted during the 1984-85 crop year. This compares with 10,600 acres harvested from the 12,000 acres planted a year earlier. Average price received for the 1984-85 crop was $10.30 per cwt compared with $14.60 per cwt the previous year. Total value was $11.4 million, up 7 percent from the $10.7 million for the 1983-84 crop year.

Freezing temperatures the third week of January caused only light damage to mature carrots. However, the younger crop suffered moderate to heavy damage. Considerable acreage was replanted. Generally, size and quality were good during the entire harvest period.

The muck soils around Lake Apopka, near Zellwood, and in the Everglades area south of Lake Okeechobee provide a good medium for growth. By far the majority of carrots are grown in the Zellwood area. The mini or finger carrot movement usually begins in late October or early November and ends by late May. Regular size carrots are harvested from November through June.

CELERY
1984-85

Florida celery marketings of 5.7 million crates were harvested from 8,600 acres during the 1984-85 growing season. The average yield of 665 crates per acre compares with 672 crates the previous year.

Prices averaged lower than the previous year at $6.38 f.o.b. per crate, compared with $10.44 per crate during the 1983-84 season. Prices averaged considerably lower in all months except June during the 1984-85 season when compared with the previous year.

The Everglades, with 80 percent of the harvested acreage in the State, was the foremost area of production throughout the season. The north central area supplemented by a light supply from the Sarasota area, accounted for the remaining 20 percent of acreage and provided continuous supplies during the season.

Plant bed preparation and seeding were in progress by mid-June. Transplanting was underway in August and became active by mid-September. Plantings in the Everglades were completed by the end of March.

Plantings were complete in the north central area by the last of April. Growers in the Sarasota area usually plant from October to March.

Light harvest began by early November in the Zellwood and Everglades areas. Growing conditions were hot and humid in the summer and early fall months. Cooler weather by November was beneficial for growth and development. Quality was generally good during most of the season. Yields and size were fair to good and averaged near normal.

Light cold damage occurred as a result of the January 1985 freeze. The winter market was steady but prices averaged below the previous year when the market was good. Prices averaged below year earlier levels. Approximately 8 percent of the crop was not harvested for various reasons. Growers passed some acreage in order to maintain good size and quality celery.

Celery production was active from November through June with May being the peak month. Cutting was completed in all areas by the middle of July.

Celery is subject to a Federal marketing order administered by the Florida Celery Committee. Field supervisors provided the basic acreage and production data. In cooperation with the Celery Committee, these data are assembled into weekly, monthly, and annual reports and published in this Annual Summary.

CHINESE CABBAGE
1984-85

Chinese cabbage is grown primarily on the mucklands of the Zellwood and Everglades areas. The organic soils provide a very good medium for rapid growth. Harvest was underway by mid-November and had reached a good volume when a hard freeze occurred the third week of January. Supplies during February were reduced but were recovering by March with good supplies through May. The season was over by mid-June. Quality was generally good during most of the growing season. Shipments for the season totaled 105,000 cwt compared with 115,000 cwt a year earlier.

SWEET CORN
1984-85

Florida, the Nation's leading sweet corn producer for fresh sales, marketed 11.1 million crates during the 1984-85 season. Production increased 2 percent from the previous year. Harvested acres totaled 51,900 compared with 55,200 harvested the previous year. Yields averaged 214 crates per acre, up 16 crates from the previous crop year.

The season average f.o.b. price of $6.06 per crate was 48 cents above the $5.58 per crate average in the 1983-84 crop season. Sweet corn ranked fourth in value of vegetables produced in the State and was exceeded only by tomatoes, potatoes, and green peppers.

First plantings of the season were underway in the Everglades and Zellwood areas in July. Seeding on the East Coast got underway in September. First harvest began in the Zellwood area in late September. Cutting in the Everglades got underway by mid-October. Harvest was virtually complete in Zellwood by mid-November. Harvest then shifted to the Everglades and increasing supply from the southeast during December. A severe January freeze caused heavy damage to mature fields in the Pompano area. Considerable acreage was lost. The Dade County crop was not affected as seriously but was young and little or no supply was available during February and March.

A cold front in mid-February brought near freezing temperatures to the Everglades and Pompano areas. Growth was slowed but little acreage was lost. Conditions improved by late February and good volume was available from southern areas by April. Peak movement for the year occurred in May when 40 percent of the crop was shipped. The Everglades became the main source of supply in late April as the East Coast and Dade County were nearing the end of harvest for the season. Spring harvest got underway in mid-May in the Zellwood area. Volume declined seasonally in the Everglades by early June and the Zellwood area became the main source of supply into early July. The season was over by mid-July.

A small acreage provides supplemental supplies from Zellwood and the west central area during the early fall and from Sarasota in the early spring.

CUCUMBERS
1984-85

Florida's production of cucumbers for fresh market during the 1984-85 crop year was 5.2 million bushels, up 13 percent from the 1983-84 crop. The 16,800 acres planted for fresh market was up 800 acres from the previous year. Fresh market harvested acres totaled 16,100, up a substantial 1,000 acres from a year earlier. Average yield per acre for fresh market, at 326 bushels, was up 19 bushels from the previous season. Total fresh market production was valued at $37.4 million compared with $34.0 million for the 1983-84 season. The fresh market price for 1984-85 averaged $7.13 per bushel compared with $7.33 the previous year.

Supplies in 1984-85 were generally available from September through June, with light marketings January through March. Many of the recorded shipments moving out-of-State January through March are from offshore and truck imports resold in mixed loads.

Prices for the 1984-85 season were higher in November, December, February and March than during the previous year. The 1984-85 spring crop prices were lower in April, May and June than during the 1983-84 season.

The production of cucumbers is well distributed across the State. The southwest area, with 37 percent of the planted acreage during 1984-85, is the largest area. The west central area accounted for 26 percent of the planted acres in the State. The southeast area was a close third with 21 percent of the planted acreage. The west and north central areas provide the remainder of the acreage.

The crop was mostly in good to very good condition during the fall. A severe January freeze killed the remaining fall crop. Damage was heavy to young plantings. Considerable replanting was necessary. Strong winds in March caused heavy plant damage in many fields. The spring crop in the Immokalee area was set back by the adverse weather. Conditions improved by April and most plantings were in good condition. Quality and yields were generally good during the spring season. Harvest was active in southern areas during May and ended by early June. Supplies were available from the west central area through mid-June and from the north area until the end of June.

EGGPLANT
1984-85

Plantings totaled 2,680 acres, up 17 percent from the 1983-84 season. Yields averaged 658 bushels per acre compared with 710 bushels for the previous season. Production of eggplant increased to 1,646,000 bushels, 10 percent above last year's production. Total sales fell to $7.1 million compared with $8.7 million a year earlier. This decrease was due to a lower yield per acre and price per bushel which more than offset the increase in harvested acres. The season average price of $4.30 per bushel is $1.54 lower than a year ago. Compared with a year earlier, prices for most months were lower, particularly for the fall and spring months.

Weather was generally good throughout the fall in all areas, continuing into January. A late January freeze caused severe damage in the Pompano area. Many older fields were cut back and allowed to grow out. The crop recovered well with the freeze damaged fields coming back into production by mid-April. Weather was favorable for good growth for the remainder of the season.

The distribution of marketings was generally normal. Harvest began in late September, reached a peak in November and dropped during the winter. Harvest began to increase in April and reached a peak in May. Harvest was virtually complete by July. The southeastern area around Pompano accounted for 50 percent of the harvested acreage. The northern and central areas combined contributed about 35 percent of the acreage harvested with the remaining acreage in the southwest.

Production is generally continuous throughout the entire crop year in the southeast and southwest. The crops in the western, northern, and central areas are for fall and spring harvest only because these areas receive too much freezing weather to grow eggplant during the winter months.

First sales were from cuttings in the western and northern areas in late September. Harvest followed the ususal pattern and progressed southward in the fall, continued through the winter in the southern areas, and then moved back northward in the spring.

ESCAROLE-ENDIVE
1984-85

Production of escarole and endive during the 1984-85 season totaled 2.9 million crates, the same as a year earlier. The 5,700 acres harvested was unchanged from the previous year. Yield per acre averaged 500 crates compared with 505 crates the previous year.

Prices during the season averaged $4.83 per crate, compared with $4.92 a year earlier. The total value of sales, at $13.8 million, was 2 percent below the previous year. The Everglades, which had 67 percent of the harvested acreage in the 1984-85 season, began seeding in late August. Weekly planting schedules continued through March. Light harvest began in late October and supplies were continuous through May. The mucklands around Zellwood provided good volume in the late spring months. The small acreage grown around the Lake Placid and Sarasota mucklands furnished supplemental supplies during much of the season.

Sales started slowly in late October and increased to a good volume by November. Marketings reached peak levels in the December through April period. Sales were complete for the season by early June.

A January freeze damaged outer leaves and delayed harvest in the Everglades. The central area sustained much heavier damage with many fields wiped out. There was extensive replanting in this area. Growing conditions were generally favorable for the remainder of the season with the exception of frost in the central area the end of March. Quality was generally good with the exception of cuttings in the weeks immediately following the January freeze when quality was considered fair.

LETTUCE
1984-85

Florida lettuce growers produced 2.3 million cwt during the 1984-85 season, unchanged from the previous year. Average yield of 170 cwt per acre compares with 179 cwt per acre for the previous season. Growers harvested 13,500 acres compared with 13,000 acres the previous year. The season average f.o.b. price of $15.90 per cwt was below the $16.84 per cwt received the previous year. Monthly prices with the exception of the first cuttings in October and the January cuttings, were below the prices of a year ago.

Acreage, production, and value statistics of lettuce in this bulletin combine the various types into a single estimate. The types in order of importance include iceberg, romaine, Boston, bibb, and leaf.

The Everglades muckland accounted for 83 percent of planted acreage and was the source of a continuous supply of good quality lettuce which began in early November and ended in late May. Outside the Everglades, Zellwood is the other major producing area, with Sarasota and the Lake Placid mucklands contributing light supplies during most of the season.

Seeding was underway in early September. All areas were actively planting by early October. The Everglades and Sarasota areas had continuous plantings through March.

Very light harvest of specialty types was underway by late October and continued light until mid-November. Volume gained significantly in December with growers cutting in most areas. The Everglades continued to provide the bulk of the volume during the winter period. Virtually all of the iceberg type is grown in the Everglades. Supplies peaked in March and declined to the season's end by late May. Volume from the Zellwood area was light during the winter months. Moderate supplies are available from this area during the fall and spring season.

Growing conditions from early fall through mid-January were favorable for good growth. A freeze in late January caused minimal damage in the Everglades area, but severe damage, in the central area, to most types. Extensive acreage was replanted. Supplies were down, as a result, in February from the central area. A heavy volume was available from all areas during March and April. Quality was generally good throughout the season.

PEPPERS
1984-85

Florida produced 10.5 million bushels of peppers during the 1984-85 season, an increase of 9 percent from the previous year. The average yield of 507 bushels per acre was 9 percent above the 467 bushels per acre last season. Harvested acreage, at 20,800 acres, was 100 acres above the previous year.

The season average f.o.b. price of $6.59 per bushel was down from an average of $7.75 for the previous season. The total value of $69.5 million was 7 percent below the previous year. Prices were below last year except for October, December, and April. Marketings were light in October but increased to a good level by December. Supplies decreased sharply during the winter months but began an upward swing in April. The peak spring production occurred in May. The season then declined and was mostly over by the end of June.

Total planted acreage decreased 300 acres from the previous season. Increases in acreage for the west central and southeast areas were more than offset by decreases for the north, north central, and southwest areas. The southeast accounted for 38 percent of the State's total pepper acreage. The southwest had 31 percent; the west central area, 12 percent; the north, 11 percent; and the north central area, 8 percent.

During September and October, hot weather necessitated spot replanting to restore stands to normal. Conditions during the remainder of the fall season were generally favorable. A hard January freeze resulted in heavy damage in all areas. Older fields with fruit were severely damaged. Replanting and planting were extremely active after the freeze. There was very little scrapping in the heavily damaged fields. Cool weather continued through much of February. Weather generally improved during March. Spring weather conditions were generally favorable. Yields and quality were mostly good.

POTATOES
1984-85

Potato production in Florida during 1985, including both winter and spring, totaled 7.9 million cwt, the same as for the 1984 crop. A total of 35,700 acres were planted for harvest in 1985. Out of this total, 35,100 acres were harvested, about 4 percent more than the acreage harvested in 1984. The value of the crop was placed at $74.7 million, up 6 percent from the previous year. This increase is attributed primarily to a 50 cent increase in the average price received for the crop. The price received for all potatoes averaged $9.40 per cwt compared with $8.90 in 1984.

The average yield for all potatoes was 226 cwt per acre, 10 cwt below last year. In the Hastings area, which includes Flagler, Putnam, and St. Johns counties, the average yield was 245 cwt per acre, down 15 cwt from last year. Spring potatoes grown in other areas of the State had an average yield of 210 cwt per acre, up 10 cwt from a year earlier. The winter crop averaged 165 cwt, up 5 cwt from the 1984 crop.

The "red-skinned" varieties are the dominant variety grown for winter harvest in south Florida. Most of the winter crop is sold for table stock but a few are sold to the potato chip industry. In the Hastings area, the "white-skinned" varieties dominate. Most of the Hastings production goes to the potato chip industry, although fresh market or table stock sales are increasing in importance.

The winter potato harvest was underway in late January and progressed through March and April. Winter harvest was very active in April. Harvest of the spring crop in the Hastings area got underway in mid-April with peak harvest in May. Digging continued into June and then declined sharply about midmonth. Abandonment was about normal throughout the season. A late January freeze delayed harvest and reduced expected yields somewhat for the winter crop potatoes. Damage to the spring crop was minimal.

SPINACH FOR PROCESSING
1984-85

Spinach statistics have not been published separately for Florida in recent years to avoid disclosure of individual operations. However, data for these seasons have been included in the "Other Vegetable" series shown in this publication. Data for 1973 and earlier are available upon request. Harvested acreage for 1985 declined from a year earlier. Most of the crop is grown in the north central area.

SQUASH
1984-85

Florida's production of squash during the 1984-85 season, at 2.8 million bushels, was 5 percent below last year. The total of 16,500 acres harvested decreased 2 percent from the previous year. The yield, at 172 bushels per acre, was down 5 bushels from last year.

The season average price of $11.00 per bushel was up 88 cents from the 1983-84 season. Total cash receipts amounted to $31.1 million. Monthly prices were higher than the previous year in all months except January and February.

Florida produces acorn, butternut, yellow crookneck, yellow straightneck, white, and zucchini squash. Dade County, with 32 percent of the State's harvested acreage in 1984-85, produces yellow crookneck squash almost exclusively. The Pompano area, in addition to being a major producing area, is also an important market for squash grown in other areas of the State. This is especially true when local supplies reach low levels during the winter months. The southwest area produces a continuous supply of most types. Central, north, and west Florida provide a good volume of most types during the fall and spring season.

Squash is one of the few crops grown in Florida that is shipped every month of the year, although shipments during the summer are light and mostly confined to local markets. The 1984-85 season got off to a good start. Marketings increased to a fall peak in November and early December, then declined seasonally during the winter months. A severe freeze in January killed nearly all plants above ground in the southwest and Pompano areas. Heavy plant damage and loss occurred in Dade County. Very light salvage harvest was possible, with very light supplies available in February. Weather improved for the spring crop and peak movement for the year occurred in April.

RADISHES
1984-85

In the 1984-85 crop year, radish plantings amounted to 29,100 acres compared with 28,800 acres planted during the previous year. Acres harvested totaled 25,600, 200 acres above the 1983-84 season. Yield per acre averaged 247 cartons compared with 207 cartons a year earlier. Production totaled 6,313 thousand cartons, an increase of 20 percent over the previous year. The crop was valued at $18.7 million, down $4.3 million from a year earlier. The average f.o.b. price was $2.96 per carton, down $1.40 from the 1983-84 season.

A good supply of both red and white radishes was available from Zellwood, Lake Placid, and the Everglades from October through May with a light volume going into June. The peak fall harvest occurred in November. The spring peak occurred in March. Seeding of the 1984-85 crop was underway in the Everglades and north central areas in early September. Early crops progressed very favorably. Light harvest was underway by mid-October and became quite active in November. In January, some acreage was lost from a hard freeze. As a result of the cold weather, replanting was necessary in the central area and supplies were reduced for several weeks. Supplemental supplies were available from Lake Placid and Sarasota during the year.

STRAWBERRIES
1984-85

Florida strawberry growers produced 8.8 million flats of berries during the 1984-85 season, up 22 percent from the previous year. Harvested acreage totaling 5,300 acres increased 4 percent from a year earlier. Average yield of 1,667 flats per acre increased from the 1,417 flats a year earlier. The f.o.b. return per flat for the season was $6.94; an increase of $1.56 per flat from the previous season. The value of the crop was $61.3 million, up $22.5 million from the $38.8 million received a year earlier.

Laying of plastic and other field work were in full swing by late September in the important Hillsborough-Manatee area. Transplanting began by early October and increased rapidly for several weeks. Transplantings were virtually complete by early November. Light harvest was underway by mid-December in the Plant City and Dade areas. Shipments began in December and increased in January. A freeze after mid-January caused bloom and some fruit loss but most growers used sprinklers to protect plants from the cold temperatures. Plant recovery from the freeze was slowed by cool weather in February. Conditions improved and 52 percent of this year's crop was harvested in March. Supplies decreased seasonally during April and ended by the last of May. Prices were lower in December and January than the previous season but were higher for the remainder of the season.

Harvest began in Bradford County in early April and continued through May. Most of the acreage in Dade County was for U-Pic and roadside stand operations.

TOMATOES
1984-85

The total value of the Florida tomato crop for fresh market and processing was $334 million for the 1984-85 season, down 9 percent from the 1983-84 season. The average price received for fresh tomatoes was $5.74 for a 25-pound carton, $1.09 lower than the previous season. This was a contributing factor to the lower value for the crop.

Total production of 59.2 million 25-pound carton equivalents was up 8 percent and a new production record for the State. Tomatoes utilized for fresh market amounted to 98 percent of the total and the remaining 2 percent went to processors. The processing segment is a secondary utilization, usually following the fresh market harvest. The Palmetto-Ruskin area accounted for 40 percent of the total production and the southwest, 24 percent. Dade County had 22 percent, Ft. Pierce-Pompano, 9 percent and the remaining 5 percent was produced in the north, north central, and western areas of the State.

The average yield for fresh market in the State was 1,223 (25-pound) cartons, up 95 cartons from the previous year. Demand for Florida tomatoes was slow during the fall season but improved during the winter and spring. Winter production was below normal as a result of a hard freeze in January. The southwest area suffered heavy losses to plants ready for harvest. Dade County, which lead in winter production, suffered major damage to mature fields with considerable acreage lost. The Pompano area received somewhat less total loss but production was reduced. The fall shipments peaked in December with 14.0 percent of the total production. January was the peak month during the winter season, accounting for 14.5 percent. February and March production was below normal due to the freeze in January. The spring production peaked in May with 24.9 percent of the total. Tomatoes are harvested from late October to early July.

Tomato planting got underway in July in all areas except Dade County where growers started during the middle of September. Planting made good progress during the fall as the weather was mostly favorable. In January, a severe freeze caused damage to tomatoes in all areas. The Palmetto-Ruskin area received continued cold weather in February resulting in moderate setback to crops. Some fields had to be replanted. Recovery was quick after the adverse weather during the winter months. The tomato crops were in good condition by spring and production returned to more normal schedules. Harvest was complete by the end of May in the southernmost areas but light harvest continued through June into early July in the other areas.

WATERMELONS
1984-85

Watermelon acreage planted during the 1984-85 season totaled 59,000 acres--an 8 percent decrease from the 1983-84 period. Of the total acres planted, 54,000 acres were harvested. This was 10 percent less than the previous season. The crop of 9.0 million cwt was 10 percent less than last season's production of 10.0 million cwt. The average yield for the State was 166 cwt per acre, down 1 percent from the previous year. The area yields were rather variable, ranging from 120 cwt in the Panhandle to 230 cwt in the south.

The average price received was $5.95 per cwt, down 25 cents from last season. Prices received by growers for melons were highest in the south and west central area where the harvest begins early. The total value of the crop was placed at $53.3 million. This was 14 percent below the record value set last year.

Some light seeding was underway by mid-December with planting very active by early January. A hard freeze in late January killed about half of the acreage in the southwest, and did considerable damage to the remaining crop in that area. Nearly all of the acreage that was up in the central area had to be replanted. Dry weather during much of February and March in the southwest necessitated extensive irrigation. Cooler weather in the northern areas during March delayed plant progress through early April.

The watermelon harvest got underway by mid-April in the Immokalee area. The season progressed northward into the central area during May and into the northern areas in June and came to an end in the western counties by the end of July. Heaviest shipping occurred during May, somewhat ahead of the previous years.

OTHER CROPS
1984-85

Cantaloups are grown in Florida primarily in the spring and summer in the southwest and north central areas. Much of the production is sold through roadside stands and local markets. The peak harvest period is normally May and June. Harvest begins in the southwest and progresses northward seasonally. Some cantaloups also are grown during the fall months in the southwest and west central areas. Acreage continues at a relatively low level. However, this crop is not part of the regular program for vegetables and melons. Researchers continue to work toward developing new varieties that will be better adapted to Florida's soils and climate. There appears to be some promise that acreage may expand in the future.

Cauliflower is grown in the Zellwood, Hillsborough-Manatee, and Everglades areas. Acreage increased from a year earlier. Supplies are available from December to April. At the present time statistics are not available for publication. Shipment information is recorded by Market News Service. In the 1984-85 season there were 101 thousand cwt (391 thousand 22-pound cartons) shipped out of the State compared with 74 thousand cwt shipped the previous season.

Tropical vegetable production during the 1984-85 season decreased from the previous year primarily because of a 21 percent reduction in harvested acres from the previous year. By far the majority of the acreage is grown in Dade County. Commercial production began in the early 60's. Tropical vegetables is a colloquial expression applied to certain vegetables eaten primarily by those of Latin American and Caribbean origin. The most common name for each crop followed by the scientific name is listed below. Other common terms for various vegetables are shown in parentheses. The crops consist primarily of boniato-Ipomea batata (sweet potato); calabaza-Cucurbita (pumpkin); malanga-Xanthosoma caracu or Colocasia esculenta (dasheen, jautia); and cassava-Manihot esculenta (crantz, yucca, tapioca). The boniato, Calabaza, and Malanga constitute the bulk of the production. The Dade County Agricultural Extension Service reported 8,500 acres of tropical vegetables planted in the 1984 calendar year. Peak production of malanga occurs in February through April. Efforts are being made to provide more even supplies throughout the year. Available land continues to be a limiting factor for all agricultural production in Dade County. New varieties of calabaza are being brought in from Columbia, South America to select those that do best in south Florida. Miami is an important point of consumption for the Florida production. Also, considerable amounts are consumed in the Tampa Bay area. The supplies shipped out of State are primarily for the New York City and Philadelphia areas.

Collard, turnip, mustard, and other greens are grown throughout the State and centered around large population areas and in the muck soils of the Everglades and Zellwood areas. Good volume was available from December through April. Shipments totaled 111 thousand cwt during the 1984-85 season, more than doubling that of a year earlier.

Okra is grown in many areas of the State during the warm season of the year. However, Dade County produces okra for local use as well as for shipments to other States. Peak production takes place in May and June with a good supply in October and November.

Green onions and leeks are produced in the north central area. Supplies are marketed primarily for local use at roadside stands and markets. There are several large producers who ship to other States. Supplies of dry onions are limited. Most of the dry onions are produced in southern and west central areas of the State.

Parsley is available in both the curley and plain types. The bulk of the commercial volume shipped to other States is produced in the Everglades and Zellwood areas. Light supplies sold for local use are available from the Sarasota, Lake Placid, and other areas.

Southern peas are grown primarily in the northwest, west central, and Everglades areas of Florida. Dade County also produces a considerable amount of southern peas. Light supplies are available from September through December. Heavy movement occurs in May and June, especially in northwest Florida. A high percentage of the crop is utilized for processing. Good supplies are sold through local markets for fresh use. Market News Service shipment statistics for out-of-State markets show 37 thousand cwt for fresh market during the 1984-85 season.

Watercress is available the year around. The major source of supply is the Oviedo area. Most of the production is shipped to northern and eastern markets in the United States. A limited supply is available from local State farmers markets, especially the Sanford market.

ACKNOWLEDGMENT

This publication summarizes basic information concerning Florida's poultry industry. It is intended for the use of poultrymen, allied industries and all others who are interested in poultry production.

Many producers, hatcherymen, marketing agencies and others voluntarily supplied information used to develop these statistics. Their cooperation is sincerely appreciated.

This summary is made possible through a cooperative effort of the Florida Crop and Livestock Reporting Service and the Bureau of Market News, Division of Marketing. Production and inventory data are official State and USDA statistics prepared by the Florida Crop and Livestock Reporting Service.

Published June 1986

Poultry and Egg Summary

Value

Florida egg production was valued at $107.7 million, down 31 percent from the 1984 total of $155.3 million. The 1985 annual average egg price of 48.0 cents per dozen was 16 cents per dozen less than in 1984. The value of broilers produced in Florida during 1985 totaled $118.8 million, a decrease of 6 percent from the record high $126.1 million of 1984. Prices in 1985 averaged 28.5 cents per pound, down 3.5 cents from 1984. The value of sales from Florida chickens (excluding broilers) was $3.6 million, up 14 percent from a year ago. Prices during 1985 averaged 8.0 cents per pound compared with 9.6 cents per pound the previous year.

Inventory

Broilers raised during 1985 totaled 104,207,000 birds, up 8 percent from a year ago. Layer numbers during 1985 averaged 10,515,000, down 12 percent from the average of a year earlier. This was the lowest number of layers in Florida since 1968.

Production

Florida broiler production in 1985 totaled 416,828,000 pounds, an increase of 6 percent above 1984. A slight decrease in bird size was more than offset by the increase in number of birds. Egg production totaled 2,692,000, down 8 percent from a year earlier and the lowest production since 1970. Eggs per layer averaged 256 during 1985, an increase from a year earlier of 11 eggs per layer and the highest rate on record.

Commercial hatcheries produced 154.5 million straight run chicks in 1985, an increase of 2 percent from 1984. Broiler-type chicks accounted for 81 percent of the total and egg-type 19 percent.

Terms and Definitions

MARKETING YEAR--Poultry production, price and value statistics since 1970 are for the marketing year beginning December 1 through November 30. All statistics prior to 1970 are on a calendar year basis. For comparability, in those tables where monthly data are shown, December entries always refer to the preceding year. All hatch and hatchery placement data are reported on a calendar year basis.

BROILERS are meat-type chickens raised commercially and usually marketed around 7 weeks of age.

EGGS include both table and hatching eggs. Table egg prices are calculated on a farm basis, cases exchanged. They include all grades and sizes, but exclude charges for hauling, grading or packaging. Prices for hatching eggs are not published separately. Annual egg production, price and value statistics are for table and hatching eggs combined.

OTHER POULTRY cash receipts include chickens other than broilers, turkeys and miscellaneous farm poultry.

CASH RECEIPTS are the returns received by farmers for all sales.

GROSS INCOME includes cash receipts plus the value of home consumption.

CURRENT YEAR data are preliminary and subject to revision.

SURVEY METHODOLOGY--Estimates for hens and pullets of laying age, pullets not yet of laying age, and of egg production are based upon data obtained from a sample of commercial chicken and egg producers. This sample is selected from the universe of Florida poultry management units, and includes approximately 80 percent of the total commercial laying flock. Estimates are expected to be within five percent of the value obtained if a complete enumeration were undertaken each month.

During December of each year all known commercial egg producers in Florida are contacted. This complete enumeration establishes the annual universe of management units. Management units include all independent producers as well as contractors who report for all contractees.

DOYLE CONNER
COMMISSIONER

Dear Friend:

The various livestock industries of Florida comprise a very important part of the State's agricultural economy. The cattle industry is especially prominent, as Florida's beef cow inventory ranks ninth among all states in the U.S.

Good statistics are necessary for the development and operation of every sound marketing program -- they are also critically important in defining and evaluating the role of agriculture in the Florida and National economies, and bear upon policy decisions directly affecting the welfare of our agricultural industries.

Florida cattle and hog producers have voluntarily provided basic State inventory data for the statistical summary of livestock and related industries. This publication has been prepared through the cooperation of the Florida Department of Agriculture and Consumer Services and the U. S. Department of Agriculture. I hope it will be a valuable information aid for you.

Sincerely,

Doyle Conner

National Agricultural
Statistics Service

ACKNOWLEDGMENT

Many livestock producers and ranchers, slaughterers, auctions, feed lots, and other agencies associated with the livestock industry offered suggestions or voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

The inventory, production, slaughter, utilization, monthly and annual average price, and livestock value statistics for Florida are official State and USDA estimates prepared by the Crop and Livestock Reporting Service. Corresponding data for other livestock producing States are from official reports of the USDA National Agricultural Statistics Service (formerly Statistical Reporting Service). Information on shipments, auction market prices, and special feeder sales are from cooperative work between the Florida Department of Agriculture and Consumer Services, Livestock Market News Section and the Divisions of Inspection and Animal Industry, and the USDA's Market News Branch, Agricultural Marketing Service.

LIVESTOCK SUMMARY

Cattle and calves

Florida's January 1, 1986 inventory of all cattle and calves totaled 2,120,000 head, down 3 percent from 1985. Florida ranked 15th in the Nation. Nationally, the inventory of 105.5 million head was down 4 percent. The decline continues the recent downward trend in cattle inventories begun three years ago.

Florida's beef cow herd, which decreased 2 percent from last year, totaled 1,135,000 head. Florida continues to rank 1st in beef cows in all States east of the Mississippi River and 9th nationally.

Feeder calves shipped out of Florida by truck from areas east and south of the Suwannee River during 1985 totaled nearly 455,000, up 4 percent from 1984. Texas, Oklahoma, California, Mississippi, and Alabama received 88 percent of the feeder calf outshipments. Rounding out the top 10 States were Kansas, Georgia, Arizona, New Mexico, and Missouri, in that order, with 9 percent of the total.

Cattle in Florida feedlots on January 1, 1986 totaled 65,000 head, down 28 percent from January 1, 1985.

Hogs on farms

The December 1, 1985 Florida inventory of hogs and pigs was estimated at 158,000 head, one percent less than a year earlier. The breeding hog inventory was up 4 percent while the inventory for market was down 2 percent.

Cash receipts

Cash receipts from cattle and calves marketed by Florida cattle producers during 1985 totaled $332,412,000, down 11 percent from 1984. Total pounds marketed were 10 percent below 1984 and accounted for most of the decrease in receipts. Calf prices were up $1.90 per cwt, but cattle prices were down $2.50 from a year earlier.

Cash receipts from hog marketings totaled $17,950,000, down 34 percent from 1984. A sharp drop in marketings and lower prices contributed to the decrease. Marketings were down 32 percent and price was off by $1.40 per cwt from the previous year.

Bees and honey

Because of budgetary restraints, the bee and honey estimating program was dropped in 1982. Only historical data are included in this summary. Beginning in December 1986, bee and honey estimates will be reinstated.

Sheep and lambs

Florida estimates for sheep and lambs were discontinued after January 1978.

Survey methodology

Primary data used in making cattle inventory estimates in this summary were obtained from probability surveys. Nationally, these surveys include approximately 70,000 farming operations heavily weighted to include operations having cattle. Information is collected by mail, telephone and personal interviews. Since all operations with cattle are not included in the sample, survey estimates are subject to sampling variability. This variability, as measured by the relative standard error, is about one percent at the national level for cattle inventory. This means that chances are approximately 95 out of 100 that a survey estimate will be within two percent of the complete coverage value if the same procedures were used to survey all producers. In Florida, approximately 1,400 cattle producers were surveyed with most of the large farms and ranches included in the count. As would be expected, the relative standard error for Florida and other states is greater than at the national level because of the smaller number of farms in the state samples.

Survey estimates are also subject to non-sampling errors such as omissions, duplications, recording and processing the data and mistakes in reporting. These errors cannot be measured directly, but they are minimized through rigid quality controls on the data collection process and a careful review of all reported data.

In setting the inventory estimates, survey information on births and deaths is used as well as inventory numbers. The survey results are combined with reliable data from other sources for slaughter, imports and exports to construct national and state balance sheets, which provide an additional check on survey inventory estimates.

Cash receipts from livestock marketings: Florida, 1976-85 1/

ACKNOWLEDGMENT

The publication of this bulletin was made possible through the efforts and cooperation of many individuals as well as private and governmental institutions. To all of them the Florida Crop and Livestock Reporting Service expresses its appreciation.

Many farmers and agricultural enterprises have voluntarily supplied information to develop these statistics. The Agricultural Stabilization and Conservation Service has been a source of much basic data on crops under USDA programs. Others contributing information were the Florida Department of Agriculture, the Agricultural Experiment Station and Cooperative Extension Service, University of Florida.

This bulletin is published by the Florida Crop and Livestock Reporting Service, a cooperative office of the USDA, Florida Department of Agriculture; and Agricultural Experiment Stations, University of Florida. Acreage, production, and value data are official statistics assembled under the direction of Jerry D.Campbell, and William C. Erwin of the Florida Crop and Livestock Reporting Service.

INTRODUCTION AND SUMMARY OF THE 1985 FIELD CROPS SEASON

INTRODUCTION

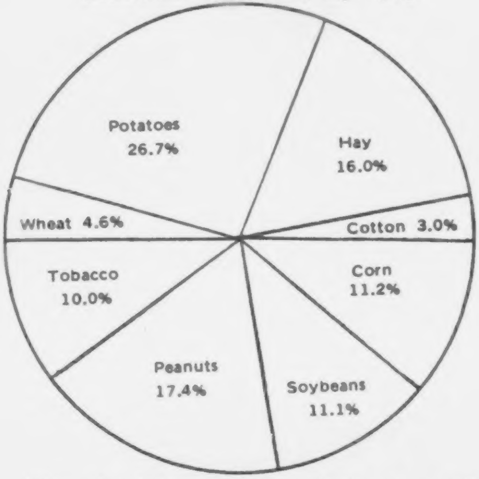
This publication, released annually, contains statewide estimates of acreage, yield, production, and value of production for all major field crops grown in Florida. The period covered for these crops is from 1975 through 1985. County data for the important producing counties which grow corn, soybeans, sugarcane, peanuts, tobacco, and cotton are published for the years 1984 and 1985. Winter wheat was reinstated in the national estimating program in 1985. Estimates were discontinued for Florida after 1978, when harvested acreage dropped to 12,000 acres. No county data are available for wheat but district totals for 1985 are published. The complete series of crop estimates dating back to 1919 for the State are available upon request.

Crop estimates are available for aiding Florida farmers, bankers, credit organizations, transportation officials, research workers, and others in the agribusiness community to evaluate trends, consider current and future needs in agriculture, and achieve optimum resource use. The estimates represent a part of the Department's continuing program to provide comprehensive data for the various segments of agriculture.

SUMMARY, 1985 SEASON

Temperatures during the first three months of 1985 averaged well below normal. Freezes occurred each week in January, twice in mid-February and one light freeze in mid-March. Small grains and sugarcane were damaged by the late January freeze but other freezes caused little damage to field crops. The first half of the year was generally dry and irrigation was used where available. Planting of spring crops was delayed in many areas. Growing conditions improved during the summer and early fall months with frequent thundershowers providing adequate moisture. Heavy rains associated with Tropical Storm Isabel and Hurricanes Juan and Kate during October and November caused extensive damage to unharvested crops and pecan trees. The surplus moisture hampered harvesting of late season crops and caused some abandonment of cotton and soybean acreage. Sugarcane harvest was active during the fall months but was interrupted briefly in December and early January by heavy rains. The 1985 crops had fair to good yields but prices received for most crops were lower than the 1984 prices. The following chart indicates the relative importance of selected field crops.

DISTRIBUTION OF FLORIDA
SELECTED CROP VALUES, 1985



The planted and harvested acres of corn continued the downward trend of recent years. Acres planted at 240,000 were down 4 percent and acres harvested for grain at 190,000 were down 10 percent from the previous year. The average yield was 65 bushels per acre, unchanged from a year earlier. The season average price dropped from $3.05 per bushel in 1984 to $2.55. The decrease in harvested acres, combined with the sharp decrease in price, pushed the value of production down to $31,493,000, a 24 percent decrease from 1984.

Acreage planted to soybeans dropped to the lowest level since 1976. During the last five years, acreage has decreased from a record high 475,000 acres to 260,000 acres in 1985. The area harvested for beans totaled 230,000 acres, a 29 percent decrease from 1984. The average yield per acre was 26 bushels, up 2 bushels from the previous year. The season average price dropped from $6.20 per bushel in 1984 to $5.20 and was the lowest price since 1975. The value of production totaled $31,096,000, down 36 percent from 1984.

The production of hay totaled 624,000 tons, down 10 percent from 1984. Total area harvested was 240,000 acres, unchanged from the previous year. Dry weather conditions during the spring caused a 10 percent decrease in yield compared with a year earlier. The season average price increased from $71.00 per ton in 1984 to $72.00 per ton in 1985. The value of production, at $44,928,000, was 9 percent less than the value for the previous year.

Total acreage planted to peanuts, at 80,000 acres, decreased 6 percent compared with a year earlier. Of the total peanuts planted, 72,000 acres were harvested for dry peanuts. The balance of 8,000 acres was either harvested as "green peanuts" for boiling, cut for hay, pastured, or abandoned. Yield per acre, at 3,000 pounds, was 200 pounds below 1984. The decrease in average price, to 22.5 cents per pound combined with a 12 percent decline in production, caused a sharp decrease in total crop value to 48.6 million dollars--down 16.9 million from 1984.

Cotton acreage continued to trend upward with 24,500 acres planted. The area harvested totaled 22,500 acres, up 32 percent from 1984. The average yield in 1985 was 693 pounds, down 154 pounds from the record yield set in 1984. The 1985 season average price per pound of 52 cents was the lowest price received by farmers since 1978. Santa Rosa County continues to dominate cotton production in the State, accounting for 58 percent of the planted acreage and 63 percent of the production.

Tobacco acreage has steadily declined since 1976. In 1985, 6,100 acres were harvested, down 13 percent from the 7,000 acres harvested in 1984. With approximately 85 percent of acreage being irrigated and with the reduced acreage being grown on better soils, yields have shot upwards in recent years. The 2,675 pounds per acre in 1985 surpassed the record yield of 2,560 pounds produced in 1984. The value of the State's tobacco crop was $27,887,000, down 14 percent from the 1984 crop. The average price for all grades sold was $1.709 per pound, down from the $1.804 received a year earlier.

Estimates for winter wheat were reinstated in 1985 for Florida. Estimates were discontinued after the 1978 crop when harvested area dropped to 12,000 acres. In 1985, there were 160,000 acres planted for all purposes. Of this total, 130,000 acres were harvested for grain. Dry weather late in the growing season, combined with Hessian fly damage in localized areas, resulted in lower yields. The average yield was 33 bushels per acre, placing total production at 4.29 million bushels. The season average price of $3.00 per bushel produced a crop value of 12.87 million dollars.

The area of sugarcane harvested for sugar and seed totaled 398,700 acres, 3 percent more than the previous season. Of this total, 383,400 acres were harvested for sugar and the remaining 15,300 acres were harvested and used for seed. The average yield was 32.9 tons of cane per acre, .3 tons above the season before. Cane production for both sugar and seed totaled 13,117,000 tons, up 4 percent from 1984. The value of production for the 1985 sugarcane crop will be available in January 1987. The value of the 1984 crop, for sugar and seed combined, was placed at $364,631,000, up 10 percent from 1983. Florida continued as the leading State in the production of raw sugar, producing 1,413,150 tons. Blackstrap molasses, 80° Brix, produced from the 1985 crop totaled 92,545,519 gallons, up 8 percent from the previous season.

Utilized production from the 1985 crop of all pecans in Florida was 2,800,000 pounds, down 44 percent from 1984 and 18 percent below 1983. Of the total pounds utilized, 1,200,000 pounds were native or seedling varieties, and 1,600,000 pounds were improved. The average price for all pecans was 64.0 cents per pound. The improved varieties brought 70.0 cents per pound, 4.5 cents more than last year. The native or seedling types averaged 56.0 cents per pound, 11.0 cents more than 1984. The value of the pecan crop at $1,792,000, was 34 percent less than the previous year and 8 percent less than 1983.

Potato production in Florida in 1985, including both winter and spring, totaled 7.9 million cwt, virtually unchanged from the year before. A total of 35,700 acres were planted in 1985, 2 percent more than 1984. Of the total acreage planted, 35,100 acres were harvested, 4 percent more than 1984. The season average price at $9.40 per cwt increased 50 cents from the previous year. The higher price received resulted in a 6 percent increase in value of production.

The average yield for all seasons combined was 226 cwt per acre, down 10 cwt from the record high of a year ago. In the Hastings area, which includes Flagler, Putnam, and St. Johns counties, the average yield was 245 cwt per acre, down 15 cwt from last year's record yield. Spring potatoes grown in other areas of the State had an average yield of 210 cwt per acre, up 10 cwt from 1984. The average yield for the 1985 winter crop was 165 cwt per acre, up 5 cwt from 1984.

The "red-skinned" varieties are the dominant varieties grown for winter harvest in south Florida. Most of the winter crop is sold for table stock but a few are sold for the potato chip industry. The "white-skinned" varieties dominate for the spring crop. Most of the spring production goes to the potato chip industry, although fresh market or table stock sales are increasing in importance.

"WHY CROP AND LIVESTOCK REPORTS"

A man's judgment is no better than his facts and crop and livestock reports are the basic facts of agriculture.

They aid farmers in planning their production and marketing and contribute to more orderly markets.

They are the basis for analysis of agriculture and other business conditions.

They enable the marketing pipeline to make better distribution of facilities for moving farm products.

They give producers the same information for projecting future price trends that buyers and dealers possess.

They are a check on fluctuation in price, by reducing uncertainty of supply.

They are the best basis for adjusting supply to demand which is highly essential if maximum price is to prevail.

They aid farm organizations, schools, researchers, and others in planning constructive programs.

They give more information on surplus and deficit areas of production, making possible a more economical distribution of products.

They provide natural disaster and emergency preparedness personnel with reliable statistics on major areas of agricultural production, the kinds of products in storage, and storage locations. This information is very important in times of disasters or other emergencies affecting loss of life or property.

They are a guide to farm resources and for developing new resources such as irrigation, electric power, location of food processing and other factories.

They reduce uncertainty which limits speculation in farm products. Speculation adds to the cost of marketing.

They indicate potential buying power, enabling manufacturers to meet the probable demand.

They provide an accurate, reliable, unbiased picture of Florida's agriculture and furnish a sound basis for judgment and action by farmers, other individuals, the business community, transportation agencies, crop and livestock interests, and governmental agencies.

ACKNOWLEDGMENT

This publication summarizes basic information concerning Florida's dairy industry. It is intended for the use of dairymen, allied industries, and all others who are interested in dairy statistics.

Many dairy producers, marketing agencies, Federal Order Market Administrators, and others voluntarily supplied basic data used to develop these statistics. Their cooperation is sincerely appreciated.

This report is made possible through a cooperative effort of the Florida Crop and Livestock Reporting Service and the Bureau of Dairy Farm Inspection, Division of Dairy Industry. Shipment data are from the Road Guard Bureau, Division of Inspection and Bureau of Dairy Laboratories, Division of Dairy Industry. Production and inventory data are official State and USDA statistics prepared by the Florida Crop and Livestock Reporting Service.

DAIRY SUMMARY

On January 1, 1986, cows kept for milk production on Florida farms and commercial dairies numbered 185,000 head, up 13 percent from the previous year. The combined total of milk cows and replacement heifers, weighing 500 pounds and over, was 221,000 head, a 6 percent increase from January 1, 1985.

Florida dairies produced 2,038 million pounds of milk in 1985, up 7 percent from 1984 and only 4 percent below the 1983 record production of 2,113 million pounds. Production per cow averaged a record high of 11,713 pounds in 1985, 678 pounds more than a year earlier.

Cash receipts from marketings of Florida milk in 1985 totaled $333,300,000, an increase of 9 percent from 1984. Milk marketed by producers averaged $16.50 per hundredweight in 1985 compared with $16.20 in 1984.

The United States 1985 annual average number of cows was [illegible],025,000 head, 2 percent more than the annual average for 1984. Milk replacement heifers on farms January 1, 1986 numbered 4,759,000 head, slightly higher than the year before.

Total milk production in the United States was 143.7 billion pounds during 1985, 6 percent more than the 1984 production. Milk production per cow averaged a record high 13,031 pounds, up 536 pounds from last year, and up 446 pounds from the previous record output during 1983.

Farmers' cash receipts from marketings of milk in 1985 were $18,135 million for the Nation, a 1 percent increase from the 1984 total of $17,944 million.
